

Safe, Natural, Bacteria Control
For Tomato & Pepper

FIELD APPLICATION INSTRUCTIONS & RECOMMENDATIONS

The following instructions and guidelines are designed to help you achieve the highest degree of bacterial control and greatest yield with AgriPhage.

Frequency

To optimize prevention of bacterial disease, AgriPhage should be applied at least once per week throughout the growing season, beginning with planting. A preventative application routine will provide optimum soil and plant health while establishing a strong base of bacterial control before problems occur. Preventative application can include spraying seeds, greenhouse applications and soil treatments.

Amount

AgriPhage should be applied to your fields one to two times per week at the rate of **one to two pints per acre** depending on the size of your crop or bacterial disease pressure severity. AgriPhage must be diluted in water at a rate between 50 and 100 gallons per acre. In times of extreme bacterial pressure, the amount of AgriPhage and frequency of application **can be increased** without causing any harm to your plants, soil, humans or animals.

The amount of AgriPhage and frequency of application **can be increased** without causing any harm to your plants, soil, humans or animals.

Timing

AgriPhage can be applied at any time of the day. It is suggested that early morning, late afternoon and nighttime applications provide the best results. Spraying when your field is moist is recommended.

Sampling

Plant leaf samples should be sent to OmniLytics for analysis every two weeks or whenever bacteria damage is suspected. Initial analysis should always be conducted for new fields or first-time applications even though damage may not be visible. Regular sampling ensures quality and enables specific targeting of bacteria.

Method Of Application

AgriPhage should be **sprayed** as a foliar application using conventional spray equipment such as a tractor-mounted boom sprayer, hand sprayers, or aerial crop duster.

Use With Other Treatments

Do not mix AgriPhage with any copper-based products or Serenade. AgriPhage may be combined with all types of fungicides, fertilizers, insecticides, etc.

AgriPhage should be added to your tank only after you have filled the tank with water and have first added any other compatible chemicals or treatments.

AgriPhage may be applied in a 3-4 day alternating rotation program with copper-manzate. Using AgriPhage regularly from season to season will result in a cleaner soil profile, healthier plants, increased yield, and a safer work environment.
