

*Safe, Natural, Bacteria Control*  
For Tomato & Pepper

## Greenhouse Application Instructions & Recommendations

The following instructions and guidelines are designed to help you achieve the highest degree of bacterial control and greatest yield with AgriPhage.

### Frequency

To optimize prevention of bacterial disease, AgriPhage should be applied at least once per day throughout the growing cycle. A preventative application routine will provide optimum soil and plant health while establishing a strong base of bacterial control before problems occur.

### Amount

AgriPhage should be applied to your houses daily at the rate between **three to eight ounces per 9,600 square feet of area**, depending on bacterial disease pressure severity. AgriPhage must be diluted in water and can be sprayed in your normal irrigation cycle. Use enough water to completely cover the exposed foliage of your plants. (See *Use With Other Applications* below). If you have visible bacterial disease pressure, increase your application rate to a **minimum of eight ounces per 9,600 square feet of area**.

The amount of AgriPhage and frequency of application can be **increased** without causing any harm to your plants, soil, humans or animals.

### Timing

AgriPhage may be applied at **any time of the day** in a greenhouse. If watering more than once per day, it is suggested to apply AgriPhage during or after the last watering.

### Sampling

Plant leaf samples should be sent to OmniLytics for analysis every two weeks, or whenever bacteria is suspected.

### Method Of Application

AgriPhage should be **sprayed** as a foliar application using conventional spray equipment such as an overhead boom sprayer or hand-held sprayer.

### Use With Other Treatments

**Do not** mix AgriPhage with any copper-based products or Serenade. AgriPhage may be combined with all types of fungicides, fertilizers, insecticides, etc.

AgriPhage may be metered directly into your watering system and applied through the automated watering system. For tank-mixing, add to your tank only after you have filled the tank with water and have first added any other compatible chemicals or treatments.

AgriPhage may be applied in a 3-4 day alternating rotation program with copper-manzate, if desired. Using AgriPhage regularly will result in a safer work environment and healthier plants.
